

Safe, effective cleaning & disinfection for everyone

Don't make yourself sick while trying to stay well! Reducing the spread of COVID-19 requires special attention to cleaning and disinfection, but many products contain chemicals that **can cause asthma** and other health problems. Proper techniques and safer products will help protect you, your family's, employees' and customers' health.

Choose safer products

Look for cleaning products with these labels – they are just as effective as other cleaning products, but safer for your health. Products with these ecolabels must meet industry standards for cleaning effectiveness, but do not contain ingredients that can cause or exacerbate asthma.

Clean first

Frequent, effective cleaning is key. Disinfectants don't work on dirty surfaces! Bacteria, fungi, and viruses cling to dirt particles, so surfaces must first be cleaned to reduce COVID-19 transmission.

Choose and use disinfectants wisely

Use safer disinfectants approved for COVID-19.

Unlike cleaning products, there are no disinfectants with ecolabels. But you can choose EPA-approved **products with safer active ingredients** that are effective against COVID-19:

- Hydrogen peroxide
- Citric acid
- Lactic acid
- Caprylic (octanoic) acid
- Thymol (if other ingredients aren't available)
- Ethanol (only where flammability is not an issue)

Safe, effective cleaning & disinfection for everyone

If possible, avoid products containing:

- Chlorine bleach (hypochlorites)
- Quaternary ammonium compounds ("quats")
- Phenolic compounds
- Peroxyacetic acid

Don't just spray and wipe disinfectants.

Disinfectants take time to work. Clean dirty surfaces first, then apply disinfectant and let it sit for the required length of time *on the label* - usually 5-10 minutes.

Focus disinfection on frequently touched and shared surfaces.

Disinfect frequently-touched surfaces such as telephones, door and cabinet handles, countertops, elevator buttons, railings, drawer handles, shopping carts and baskets, check-out areas, cash registers, payment equipment, self-check-out kiosks, food/item display cases, refrigerator and freezer case doors, chairs used by personnel or customers, and tools and other devices which require handling throughout a work shift.

Create a plan.

Frequently disinfect any break rooms, bathrooms and other common areas. Create and use a daily checklist to document each time disinfection of these areas occurs. Consider appointing a designated sanitation worker for these tasks.

Use personal protective equipment (PPE).

Check product labels for information about required PPE such as goggles and gloves, especially when mixing concentrated products.

Use disinfectants only on surfaces, never on your body.

Disinfectants can be dangerous if misused.

Special considerations during shelter in place

Don't forget pests

With many workplaces now vacant, look for signs of rodent infestations, such as **droppings** under furniture or in corners. Make sure all food is removed from desks in unoccupied workspaces.

Follow the latest Department of Public Health directives

These **directives** include requirements, checklists, and best management practices for businesses operating during the COVID-19 pandemic. They are based on the latest **CDC guidance**.
